# Topics

Electric Field (Coulomb's Law)

Electric Current

Magnetic Field

EM Induction

EM Waves  $\rightarrow$  Light

Optics

"Modern Physics" (atomic level)

We study one particular force

Force from elec. charges, elec currents

Aside from gravity all forces you

experience are electrical

Start class w/ electrical forces  
at a fundamental simple level.

---

Electric  
Charge is a basic property of mass  
(Like ~~mass~~)

All particles have a certain electric charge

We find: Particles in  
nature have charges which  
are multiples of  $e$

(2 types of charges  $+$  and  $-$ )

Charge is quantized

Charge is measured in Coulombs.

$$e = 1.602 \times 10^{-19} \text{ Coulomb.}$$

(Coulomb of charge is big)

Charge can't be destroyed. (Conserved)

Charges of same sign repel  
Opp. sign attract.

Normally in "life" charges cancel, don't  
see effects of electricity

Attr<sup>than</sup> + =  
Stronger + +  
than

Wall becomes  
polarized

# Basic Law of Electrical Forces

point charges

Same sign

$$F \propto \text{charges}$$
$$\propto 1/r^2$$

$$|\vec{F}| = k \frac{|q_1 q_2|}{r^2}$$

$$k = 9.0 \times 10^9 \frac{\text{Nm}^2}{\text{C}^2}$$

$$\vec{F}_{1 \text{ on } 2} = k \frac{q_1 q_2}{r^2} \hat{r}$$

$\hat{r}$  points from 1  
to 2

20.14 A typical lightning flash  
delivers about 25 C of neg. charge  
from cloud to ground.

How many electrons

$$25 \text{ C} = (\# \text{ electrons}) (1.602 \times 10^{-19} \text{ C})$$

$$\# \text{ elec} = \frac{25 \text{ C}}{(1.602 \times 10^{-19} \text{ C})} = \boxed{1.6 \times 10^{20} \text{ elec}}$$

20.16 Electron & proton in a H atom  
are 52.9 pm apart.

Find magnitude of electrical force between  
them

$$|F| = \left| k \frac{q_1 q_2}{r^2} \right| = (9.0 \times 10^9 \frac{\text{Nm}^2}{\text{C}^2}) \frac{(1.602 \times 10^{-19} \text{C})^2}{(52.9 \times 10^{-12} \text{m})^2}$$
$$= 8.25 \times 10^{-8} \text{ N}$$
